

AOBP je u dětí také asociována s HMOD jako v dospělosti.

## Závěr

Automatický TK je novou metodou měření TK v ordinaci lékaře, jejíž velkou předností je vyloučení hypertenze bílého pláště. V součas-

nosti je relativně často využívána v ordinacích praktických lékařů pro dospělé v oblasti Kanady a USA a doporučována evropskou hypertenzní společností. Další předností metody je časová nenáročnost, která ji řadí mezi skřínkové metody, a finanční dostupnost. V dětském věku je nutné dořešit souvislost s HMOD a referenční

hodnoty pro AOBP, ale již nyní ji lze ve specializovaných ambulancích využít k porovnání s příležitostnými hodnotami TK.
